

What is Nibook.com?

Nibook is a **SaaS booking platform built for service professionals** — hair stylists, coaches, nutritionists, consultants, and similar businesses, primarily targeting the African market (Kenya, Uganda, Tanzania). It lets a business owner create a branded public booking page, manage appointments, accept payments, and collaborate with a team — all from one dashboard.

Architecture & Tech Stack

Layer	Technology
Frontend	Next.js 14 (Pages Router), React 18, TypeScript
UI	shadcn/ui (Radix primitives), Tailwind CSS, Lucide icons
Auth	Clerk (sign-up/sign-in, JWT for Supabase RLS)
Database	Supabase (PostgreSQL with Row-Level Security)
Payments	Jenga API (M-Pesa, bank transfer) via Supabase Edge Functions
State	React Query for server state, local state for forms

Multi-Tenant Design

The app is **multi-workspace**. Each business is a "workspace" with its own slug, team, services, bookings, settings, and billing. A single user can own or be a member of multiple workspaces. The database schema enforces this:

- **profiles** — one per Clerk user (identity)
- **workspaces** — one per business (tenant boundary)
- **workspace_members** — many-to-many with roles: `'owner'`, `'admin'`, `'staff'`
- Everything else (services, bookings, availability, settings, subscriptions) is **scoped to a workspace**

User Journeys

1. Landing Page (Landing.tsx)

A marketing page showcasing features (Smart Scheduling, Flexible Payments, Availability Control, Public Page, Client Management, Instant Notifications), social proof stats, testimonials, and a Free vs Pro pricing comparison. CTAs direct visitors to sign up or sign in.

2. Sign Up / Sign In (signup, login)

Handled entirely by Clerk. After authentication, the middleware (middleware.ts) lets Clerk manage session cookies and JWT issuance.

3. Onboarding (Onboarding.tsx)

A 4-step guided wizard for new users:

1. **Business Profile** — name, category, description, location, phone, email
2. **First Service** — name, duration, price
3. **Availability** — toggle days on/off, set start/end times
4. **Review & Launch** — confirms everything and creates the workspace + service + availability rows in Supabase

After onboarding, the workspace gets a unique slug and is immediately live.

4. Dashboard (Dashboard.tsx)

The main hub after login showing:

- **Dynamic greeting** with time-until-next-appointment
- **Upcoming bookings** (up to 3) with dropdown actions (View Details, Cancel)
- **Quick stats** — total revenue, completion rate, active connections, top service
- **Active services** preview
- **Quick-access cards** — links to Analytics, WhatsApp, Integrations, Support
- **Team CTA** — prompt to invite team members
- **FAB button** — floating action to create a new service

5. Services (Services.tsx)

CRUD management for the services a business offers. Each service has:

- Name, duration (minutes), price, currency (KES default)
- Description, cover image (with client-side compression & Supabase Storage upload)
- Active/inactive toggle
- Image gallery support

Services are displayed as cards with edit/delete actions via dropdown menus.

6. Bookings (Bookings.tsx)

Full booking management with:

- **Tab filtering** — All, Upcoming, Completed, Cancelled
- **Search** by client name or service name
- **Date range filter**
- **Add booking** manually (owner creates a booking for a walk-in/call-in client)
- **View details** dialog — full booking info
- **Reschedule** — pick a new date and time
- **Cancel** — with confirmation dialog
- Payment method display (M-Pesa, Bank Transfer, PayPal, In Person)

7. Availability (Availability.tsx)

Weekly schedule editor:

- 7-day grid with on/off toggles per day
- Start/end time selectors (30-minute increments, 06:00–22:00)
- **Booking rules** panel (buffer between appointments, minimum notice, max advance booking) — currently UI-only, not persisted

8. Settings (SettingsPage.tsx)

Comprehensive configuration page with sections:

- **Page Theme** — choose from preset themes (Classic, Midnight, Ocean, Forest, Rose, etc.) with live preview fonts
- **WhatsApp Notifications** — configure via Meta Cloud API, Twilio, or custom webhook; set reminder hours, confirmation templates
- **Connections** — toggle integrations (Google Calendar, Slack, OpenAI MCP, Zapier) with credential setup dialogs
- **Payment Methods** — enable/disable M-Pesa, Bank Transfer, PayPal, In-Person; each has its own configuration fields (paybill, account number, etc.)
- **Support** — set preferred support channel, contact email, notes
- **Unsaved changes indicator** — Save button shows a ring + dot when config differs from saved state

9. Team (Team.tsx)

Team management (Pro feature, limit of 3 seats):

- View current members with roles (Owner, Admin, Manager, Staff)
- **Invite** new members by email with role selection
- **Change roles** / **Remove members**
- Pending invitations tracker with resend/cancel options
- Role-based permission display

10. Pricing (Pricing.tsx)

Billing page showing:

- **Free plan** — up to 3 services, 10 bookings/month, basic features
- **Pro plan** — KES 1,500/month, unlimited services/bookings, custom branding, analytics, team accounts, WhatsApp, priority support
- **Usage meter** — progress bars for services and bookings used vs limits
- **Jenga Checkout** integration — triggers a Supabase Edge Function that creates a payment order and redirects to Jenga's hosted checkout for M-Pesa/bank payment
- Payment callback handling via URL parameters (`?payment=success&txn\_id=...`)

Public Booking Flow (PublicBooking.tsx)

This is what **clients** (end users) see when they visit a business's booking link (`/book/[slug]`). It's a 4-step wizard:

1. **Select Service** — browse active services with images, prices, durations; click for a detail gallery dialog
2. **Pick Date & Time** — calendar respects the business's availability schedule; time slots are generated in 30-minute increments and **double-booking prevention** filters out already-occupied slots
3. **Your Details** — name, email, phone, and **payment method selector** (only shows methods the business has enabled)
4. **Confirm** — summary of everything; submit creates a booking row in Supabase

The page is **themed** according to the business's chosen theme (fonts, colors), and optionally shows a WhatsApp contact button if the business has WhatsApp enabled.

Data Flow

...

For the **owner-side**, all data access goes through authenticated hooks in `src/hooks/use-workspace-data` that attach the current workspace ID and Clerk JWT to Supabase queries.

Billing Architecture

Component	Role
--- ---	
`subscriptions` table	Tracks plan, status, billing cycle per workspace
`usage_metrics` table	Tracks services/bookings used vs limits
`payment_orders` table	Records Jenga checkout attempts and results
`jenga-checkout` Edge Function	Creates order, calls Jenga API, returns form data

| `jenga-callback` Edge Function | Receives payment webhook, updates order + subscription
|

Key Design Decisions

- **Currency**: KES (Kenyan Shilling) as default — the product targets East African service businesses
- **No server-side rendering for data**: All data fetching is client-side via React Query + Supabase client
- **Public pages are unauthenticated**: The booking page fetches data directly from Supabase without requiring login
- **Image handling**: Client-side compression (via `browser-image-compression`) before upload to Supabase Storage
- **Route guard**: A `RouteGuards` component checks if the user has completed onboarding and redirects accordingly
